

Did you know that 9 out of 10 Cattle Ranchers are now doing less work yet doing more efficiently using this TOOL?

Well, it's not "TOP SECRET" anymore.

After cows have their calves, farmers and ranchers need a way to transport the new borns.

The Calf Carrier is the answer!

The calf carrier will mount to any atv with a receiver hitch. Adapters available for units without a receiver hitch. Place the calf on the carrier (backwards) in between the two half moon holders, the mother follows right along, making it safe and easy to transport a new born calf. The 1" square tube (perpendicular to the center tube frame) keeps the calf from kicking it's way out. The round plastic tube in between the half moon holders helps to protect the calves naval.

You can pull the tail up and the calf will pop out once you get to your location.
